Subject:	J2ME client loses server or makes redundant vibration		
Description:	<p>On Nokia 6120 mobile client loses server, while coordinates window works ok (shows all data). I've noticed that internet periodically goes down. The 3G connection becomes inactive. A few seconds later internet restored, but wannatrak does not find it and continue to vibrate.</p> <p>The second bug is that wannatrak vibrates for a second in approx. two minutes. It does not display any errors, but in fact it lost GPS device - coordinates window says there is no data. This bug is not very often - today I met it two times only.</p> <p>Another bug. When application just have started it makes a small vibration (status is "tracking not possible") and after it status changes to "tracking".</p>
